Timed automata

Eugene Asarin

Introduction

TA: the model Decidability

Timed language theory

Timed symbolic dynamics

Conclusions

Timed automata

- A model for verification of real-time systems
- Invented by Alur and Dill in early 1990s
- Precursors: time Petri nets (Bethomieu)
- Now: an efficient model for verification, supported by tools (UPPAAL)
- A popular researh topic (¿8000 citation for papers by Alur and Dill)
 - modeling and verification
 - decidability and algorithmics
 - automata and language theory
 - very recent: dynamics
- Inspired by TA: hybrid automata, data automata, automata on nominal sets

What are TA

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Introduction

Timed

Eugene Asarin

TA: the model Decidability

Timed language theory

Timed symbolic dynamics

Conclusions

Recipe: how to make a timed automaton

- take a finite automaton
- put it into continuous time
- add some variables x_1, \ldots, x_n , called clocks.
- make all them run: $\dot{x}_i = 1$ everywhere.
- add guards to some transitions (e.g. $x_3 < 7$)
- add resets to some transitions (e.g. $x_2 := 0$)
- serve and enjoy!

Eugene Asarin

Introduction

TA: the model Decidability

Timed language theory

Timed symbolic dynamics

Conclusions

An example of a timed automaton • Timed automaton (we forget to write $\dot{x} = 1$):

Timed symbolic dynamics

Conclusions

Preliminary considerations

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- Aim: describe timed regular languages as dynamical systems
- Solution: from Nicolas Basset's MSc thesis (2010)
- Limitations: deterministic automata, bounded intervals between events

Shifts

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Timed automata

Eugene Asarin

ntroduction

TA: the mode Decidability

Timed language theory

Timed symbolic dynamics

Conclusions

Full timed shift

- Fix Σ an alphabet and $M \in \mathbb{R}$.
- Let C = Σ × [0; M] a compact set (with a natural metrics).
- S = C^ℤ: set of bi-infinite timed words (with a natural metrics). E.g. ... t₋₁a₋₁t₀a₀t₁a₁t₂...
- Shift $\sigma: S \to S$ E.g. $\sigma(\{c_n\}) = \{c_{n+1}\}.$

- Shift $\sigma: S \to S$ E.g. $\sigma(\{c_n\}) = \{c_{n+1}\}.$

The simplest example: studied by Weiss and Lindenstrauss!

•
$$\Sigma = \{a\}; M = 1; C \cong [0; 1]$$

• $S = [0; 1]^{\mathbb{Z}} = \{t_{-1}, t_0, t_1, \dots\}$

Timed subshifts

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Definition

A subshift $X \subset S$ with X closed and σ -invariant.

Two standard ways to define subshifts

- by an open set of forbidden patterns;
- by a closed set of allowed patterns for some lengths.

A timed automaton

- which is deterministic, w/o initial final states;
- with closed guards;
- corresponds to a timed subshift;
- we call it sofic!

Entropy renormalized

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

We still try!

Given a timed subshift L

- Define L_n -set of timed words of length n (btw $L_n \subset \mathbb{R}^n \times \Sigma^n$)
- Define $C(n, \epsilon)$: size of ϵ -net in L_n .
- Compute it: $C(n,\epsilon) = (1/\epsilon)^n \operatorname{Vol}(L_n)$.
